

INTENET

InteNet is designed for the Australian Hay and Silage market, providing a strong, reliable Netwrap in both application and performance.

InteNet is the choice for 'all-round' general purpose Round bale Hay or Round Bale Silage and has been a consistent performer for many seasons here in Australia.

InteNet - Exclusive to CRT

ORDER CODE	DESCRIPTION	3 Wraps	4 Wraps	5 Wraps
NET0005	InteNet 1.23m x 2600m	230	172	138
NET0007	InteNet 1.23m x 3600m	319	239	191
TBA (new)	InteNet 1.30m x 3600m	319	239	191

*MINIMUM WRAPS PER BALE FOR ALL NETWRAP PRODUCTS *SILAGE CROPS: 3 WRAPS *HAY CROPS: 4 WRAPS *STRAW CROPS: 5 WRAPS

USAGE AND APPLICATION

InteNet achieves secure crop protection in complete round bales in hay or silage in all crops. Correct tension on the netwrap will aid full bale coverage. Check baler manual for maximum allowable widths of Net.

A minimum of 3 wraps is recommended for Silage, 4 wraps for hay, and 5 wraps for straw.

It may be necessary to increase the number of turns depending on the baler, bale pressure, bale diameter and crop conditions.

FEATURES AND BENEFITS

- Long running length for maximum daily baling efficiencies
- Provides full bale coverage in 1.23m width
- Provides over the edge coverage in 1.30m width.
- Designed for general Hay & Silage round baling in Modern high capacity machines
- Manufactured from the latest generation of high Quality resins for high pressure & tear resistance
- Designed for Australian conditions with 12 Month guarantee against UV degradation

FAQ'S

- Is InteNet suitable to use in all current model's of balers?
Yes, InteNet can be used on all current makes & models of Balers.
- Will my baler be able to use the 1.30m width of InteNet?
Please check with your machines manual, but most Round balers post the year 2000, are suitable to run a 1.30m wide Netwrap.
- How many revolutions (or layers) of Netwrap do I need to achieve a sufficiently wrapped bale for transport & storage?
Industry standards set a minimum of 3 wraps for Silage, 4 wraps for Hay and 5 wraps for Straw. If bales are being pressed at higher pressures and crop is dry and springy, then additional layers may need to be applied for sufficient holding capacity.

FAQ'S

- If my Netwrap is not spreading out to the edge of the bales, what can be done to correct this?
All bales have a brake tension system for applying pressure to the net during application. This brake may need to be tensioned or release tension to get correct spread of Net across the bale. Again please refer to Baler Machine manual for tensioning instructions.
- The Netwrap is tracking to one side of the bale and not giving full coverage to the other side of bale?
There a few possibilities for this:
 - The Net may not be centered on the mandrill correctly
 - There may be an obstruction on the feed rollers such as hay/silage build up.
 - Brake tension may need adjusting
 - The windrows are uneven, thus causing the pick up to unevenly load the chamber.
 - Refer to Baler instruction manual.
- The Net does not cut cleanly after application and threads catch on the belts and rollers when I start baling again.
Inspect knife or cutter system to make sure it's sharp or cut off system is aligned correctly for even cutting. Refer to your Baler instruction manual for directions.
- How long can I expect InteNet to last?
Integrated Packaging BaleNet is guaranteed for 12 months against UV degradation
- What can I do to help store my wrapped bale of Hay for longer?
Applying additional layers of Net is suggested for storing Hay for longer periods.
- What can I do to help the storage process of my Round Hay bales?
Start with a well cleared site for stacking, preferably shedded out of the weather. Placing Rodent bait stations around the perimeter of the Hay stack will help prevent attack by Rats & mice.
