

PITCOVER 150µm

IP's 150µm Pitcover provides maximum protection for Silage Pits in the harsh Australian climate. Manufactured with the latest technology in polyethylene resin, Pitcover offer's strength and resistance against tears and punctures.

Built with three layer film technology, white/black to reflect heat and maintain ideal anaerobic storage conditions for ensiling forage.

APPLICATION	IP CODE	DESCRIPTION	COLOUR	ROLLS PER PALLET
SILAGE PITS	PIT0002	PITCOVER 18M X 50M X 150µm	BLACK / WHITE	9
SILAGE PITS	PIT0005	PITCOVER 18M X 300M X 150µm	BLACK / WHITE	1

USAGE AND APPLICATION

When applying to the pit after rolling & compaction, ensure as much air as possible is forced out of the pit to create an air tight seal. Firmly secure all edges of the silage cover to prevent movement during storms and winds.

To assist in achieving optimal feed quality, Integrated Packaging recommend the use of Sil-ALL 4x4™ inoculants to ensure correct numbers of beneficial bacteria are present to maximize the speed of formation and the reduction of storage losses in all silage making methods with all forages in pits, bunkers and bales.

Place with black layer facing down and white layer facing up to reflect sunlight and heat away from the silage pit. This will reduce the chance of Pit fires and minimising mould growth and spoilage beneath the silage cover.

FEATURES AND BENEFITS

- Three layer Film technology
- 150µm thickness for strength & durability
- Full UV stabilised for long lasting performance
- High puncture & tear resistance
- Choice of rolls widths to suit pit sizes
- Manufactured to International Quality Standards
- Designed for Australian conditions with 12 Month guarantee against UV degradation.

FAQ'S

- How can I successfully make an air tight Silage Pit?

Sealing stack ASAP after adequate compaction. Bury edges of cover in the ground and regularly check the stack cover over time for holes and patch as necessary.

- How can I reduce silage spoilage/dry matter losses in my Silage Pit?

Ensiling fodder with correct dry matter (DM) percentage and even and continuous adequate compaction of Silage material across the width and length of the Pit is required when making Pit. Also the use of Silage Inoculants to ensure rapid fermentation will assist in reducing spoilage losses.

- What size Silage Pit is best?

Silage pit size is determined by many varied criteria relevant to animals to be fed and general farm management and practices, however a general rule for best practice are that a long, narrow, deep stack is more effective for good Silage quality.

- How long will my Silage Pitcover last?

Integrated Packaging Silage Pitcovers are guaranteed for 12 months against UV degradation.

- Can I re-use my Silage Pitcover again the next season?

IP would not recommend re-using the cover again in the second season, due to potential UV degradation and the potential for small holes in the cover due to prior use.
